

MODELMAKING MADE EASY

New service to create and 3D print architectural scale models

Holding a 3D scale model of a design you have spent many hours on creates a special feeling. A real life scale model tells you much more than a digital file.

i.materialise, an online 3D creation and 3D printing service, enables you to build 3D scale models in an easy way and with a high level of detail. Models are a nice way to better visualize houses, interiors, buildings or environments.

i.materialise is now proud to present their **Google SketchUp plugin**, which guides you through creating a scale model and preparing it for 3D printing in only 4 simple steps.

The plugin provides you with simple tools to position and scale your models. You can apply textures and colors as you like as well as 3D printable models such as cars, trees or other items.

The plugin is ideal if you are an architect, if you want to visualize your (future) house or interior, or if you just want to have fun in 3D modeling.

Once you are happy with your scale model, you can build it on a **Z Corporation** 3D printer, at a fixed and affordable price.

Sounds like fun? Try it out!
